

## Concrete repair work: Dry spray (Guniting)

Sprayed concrete represents a viable alternative method for concrete reinstatement.

Main advantages

Overhead work, where high impact bonds and substrate adhesion values are required.

The requirement for shuttering is minimal, compared to fluid flow casting.

High level work such as cooling towers or chimney stacks are easily accessible.

Where concrete pumps cannot operate, i.e. high level, off-shore or restricted access.

High volume of placement compared to hand rendering.

Monolithic layering as opposed to multiple layers with hand applied mortars.
